```
This sequence represents a 3' untranslated region (UTR) which was used in the construction of the recombinant expression cassette of the invention. The expression cassette is for effecting expression of a foreign gene in a transformed plant and comprises a promoter operable in plants, an untranslated leader sequence, a foreign gene of interest, and a 3'UTR. This cassette may be used to transform plants, for genetic engineering of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated DNA molecule useful for genetic engineering of plants or for improving the expression of transgenes in plants, particularly corn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; 3' untranslated region; UTR; expression cassette; transformed plant; promoter; untranslated leader sequence; genetic engineering.

The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lighin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, introgen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one state of the content. This sequence represents a plant full length insert content. This sequence represents a plant full length insert properties of the plant of the recombination to the cost of the content. This sequence represents a plant full length insert properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1016

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the production of immunoglobulins in plants, wherein at least a portion of the glycans attached to the immunoglobulins to lack fucose. The immunoglobulins produced can be of any class (i.e., IgG, IgA, IgM, IgB or IgD) and is especially an anti-herpes simplex virus (HSV) antibody or an anti-alphaVbeta3, alphaVbeta5 dual integrin antibody. The invention also relates to constructs, plasmids and vectors corp producing the immunoglobulins; transformed plant cells, calli, plant tissues and whole plants for producing the immunoglobulins, the immunoglobulins; methods for producing the immunoglobulins of the invention use of such immunoglobulins. The immunoglobulins of the invention may be used to treat HSV infection or tumour angiogenesis. The invention production, the invention of provides the advantages of antibody production in plants, such as large contaminants such as viruses and elimination of pathogenic contaminants such as viruses and elimination of pathogenic contaminants such as viruses and prions, with a simplified (i.e., non-plant specific) glycosylation profile which reduces the risk that the immunoglobulin may not be functional in animals. The present sequence represents the plasmid pubasol4, which may be used in the invention. The plasmid contaminants and contaminants for a plant specific players and contaminants for a plasmid pubasol4, which may be used in the invention. The plasmid contaminants and contaminants and contaminants and contaminants and contaminants and contaminants in the invention. The plasmid contaminants and con

                                                                                                                                                                                                                           New plant host cell system for producing a desired glycoprotein comprises a mammalian N-acetylglucosaminyltransferase (GnTIII) enzyme, a nucleic acid sequence encoding the enzyme, or a vector comprising the nucleic acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     241 ACTACTTGGGTTTGTTGAATTATTATGANCAGTTGCGTATTGTAATTCAGCTGGGCTACC 300
                                                                                                                                                                                                                                                                                                   The invention relates to a plant host cell system comprising a mammalian UDP-N-acetylglucosamine: beta-D mannoside beta(1,4)-N-acetylglucosamine: beta-D mannoside beta(1,4)-N-acetylglucosaminyltransferase (GATIII) enzyme, a nucleic acid sequence encoding a mammalian GATIII protein, or a vector comprising the GATIII nucleic acid. The plant host system is useful in producing a desired glycoprotein or its functional fragment. The glycoprotein or its functional fragment may be used for the production of a pharmaceutical composition. The present sequence represents the nucleotide sequence of plasmid pDABBS04
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

                                                                                                                                                                                                                                                                                                                                         9
                                                  system comprising a mammalian
                                          The invention relates to a plant host cell system comprising a mammaliar UDP-N-acetylglucosamine: beta-D mannoside beta(1,4)-N-acetylglucosamine: beta-D mannoside beta(1,4)-N-acetylglucosaminyltransferase (GnTIII) enzyme, a nucleic acid sequence encoding a mammalian GnTIII protein, or a vector comprising the GnTIII nucleic acid. The plant host system is useful in producing a desired glycoprotein or its functional fragment. The glycoprotein or its functional fragment may be used for the production of a pharmaceutical composition. The present sequence represents the nucleotide sequence of plasmid pDAB7113
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Transgenic plant; immunoglobulin production; recombinant production; glycosylation; fucose; glycan; virucide; immunotherapy; maize; gamma-zein promoter; rice; actin promoter; phosphinothricin acyltransferase; PAT; mouse; leader sequence; herpes simplex virus; HSV1; HSV2; human; monoclonal antibody HX8; IgA; heavy chain; light chain; codon optimised; plasmid; pDABBSO5; cyclic; circular; ds.

ADP73931

```
The invention relates to the production of immunoglobulins in plants, wherein at least a portion of the glycans attached to the immunoglobulins completed to the immunoglobulins produced can be of any class (i.e., 1gG, 1gA, 1gM, 1gE or 1gD) and is especially an anti-herpes simplex virus (HSV) antibody or an anti-alphavbeta3, alphavbeta5 dual integrin antibody. The invention also relates to constructs, plasmids and vectors (CC antibody. The invention also relates to constructs, plasmids and vectors for producing the immunoglobulins; transformed plant cells, calli, plant tissues and whole plants for producing the immunoglobulins; the immunoglobulins; methods for producing the immunoglobulins, the immunoglobulins of the invention cuse of such immunoglobulins or tunour anglogenesis. The invention may be used to treat HSV infection or tunour anglogenesis. The invention contaminants such as viruses and pricons, with a simplified (i.e., non-plant-specific) glycosylation profile which reduces the risk that the plant average of encional in animals. The present sequence represents the plasmid phabas50s, which contains codon optimised DNA sequences encoding the heavy and light chains of the human anti-HSV1/HSV2 of manice endosperm-specific gamma-zein promoters. The plasmid also contains a phosphinotricin acyltransferase (PAT) gene under the control of a rice and promoters. The plasmid also

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at available in electronic form from the US patent office at the sequence. The sequence is useful for a plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease. For producing galactomannan. Iignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content This sequence represents a plant full length insert polynucleotide that can be used in the recombinant DNA construct of the Claim 1; SEQ ID NO 32117; 15pp; English.

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, heatbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert content.
                                                                            New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for
                                                                                                                                                                                                                  Claim 1; SEQ ID NO 5169; 15pp; English.

recombinant DNA construct, useful for improving plant tolerance to 1, heat, drought, herbicides, extreme osmotic conditions, pathogens or s, for conferring increased resistance to plant disease, or for improving yield. pests,

Claim 1; SEQ ID NO 5111; 15pp; English.

ò

The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent of fice at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or perse, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, ceombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stream of the content. This sequence represents a plant full length insert content. This sequence represents a plant full length insert of the content. This sequence represents a plant full length insert of the invention

```
The invention relates a recombinant DNA construct comprising a polypucide polynucleotide having any of 5544 mucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polypetide with any of 5544 maino acid sequences (SEQ ID NO: 5455-11088). The CDNAs and proteins are from corn, soybean, a rabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a producing a plant having an improved property, comprising transforming a conductional in a plant cell operably joined to a polymorter region control plant. The property is selected from improving plant cold tolerance, for pathway, for improving plant drought tolerance, for pathway, for improving plant drought tolerance, for pathway, for improving plant drought tolerance. For production of pathway, for improving plant drought tolerance, for production for improving plant tolerance to herbicides, for increasing the rate of homologous recombination in plants, for ingroving plant tolerance to herbicides, for increasing the rate of homologous recombination in plants, for ingroving plant tolerance to extreme osmotic conditions, for improving plant tolerance to bethicides, for increasing the rate of homologous recombination in plants, for ingroving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or peats, for yield improvement by modification of photosynthesis, for modifying seed oil yield and/or content, for modifitying eed protein yield and/or content, for modifitying eed protein yield and/or content, for yield improvement by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     drought tolerance; disease resistance; galactomannan production; plant growth regulator; heat tolerance; herbicide tolerance; lignin production; extreme osencic condition tolerance; pathogens resistance; pest resistance; yield improvement; seed oil yield;

modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and development under at least one stress condition. The polynucleotide may also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of blochemistry and genetics, in particular for producing transgenic plants with improved biological characteristics such as increased yield, improved nitrogen flow, increasing plant tolerance to cold or heat, improved nitrogen flow, increasing plant tolerance to cold or heat, improved nitrogen tolerance to extreme osmotic and drought conditions, and improving plant tolerance to plant pests or pathogens. They can also be used in physical arrays of molecules, plant breeding markers, computer-based storage and analysis systems. The present sequence is one of the 5544 plant cDNA sequences of the invention. Note: The sequence data for this patent did not computer form part of the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1191 GTGTACTACTTGGGTTTGTTGAATTATATGAGCAGTTGCGTATTGTAATTCAGCTGGGC 1250

```
The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in meletronic form from the US patent office at available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as the invention are also useful in physical arrays of molecules and as improving plant tolerance to cold, hear, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, ignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosopyntheeds or carbohydrate, nitrogen or phosphorus use and/or uptake conviding improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert

The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lighin or plant growth regulators, for increasing the rate of homologous recombination in plantes, for improving yield by modification of photosynthesis or carbohydrate, introgen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stream of the content. This sequence represents a plant full length insert of the polymore or plant can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for

of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polymucleotide that can be used in the recombinant DNA construct of the

The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the sequence. The recombination of the polymucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, cecombination in plants, for improving yield by modification of photosynthesis or carbohydrate, introgen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one strong content. This sequence represents a plant full length insert content. This sequence represents a plant full length insert of the increase.
                                                                                                                                                                                                 New recombinant DNA construct, useful for improving plant tolerance to ocld, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.
                                                                                                                         Cao Y;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1216 BP; 282 A; 342 C; 402 G; 190 T; 0 U; 0 Other;

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Individual basecall and confidence value were assigned using the
Individual basecall and confidence value were assigned using the
bred software (http://www.phrap.org/). Overall sequence quality
assessment and vector trimming was conducted using the bucy
software (version 1.16s, http://www.tigr.org/softlab/). Lucy
parameters were set to ensure an overall trimmed quality of 97.5$
or better without any vector fragments in the chosen high quality
region of each sequence. Low-quality bases between the poly-T and
the high-quality region were replaced with N's to serve as spacers
using a Perl program (est_process.pl), written by Dr. Hui-Hsien

acid)-treated seedlings; GATGCC--Kinetin-treated seedlings; AAGACC--ACPC (1-aminocyclopropane-1-carboxylix acid)-treated seedlings; GCCTGA--Brassinolide-treated seedlings; GCTGA-BA (Abbacisic acid)-treated seedlings; TACGGA--GA (Gibberellic acid)-treated seedlings; TACGGA--GA (Gamonic acid)-treated seedlings; Equal amounts of first-strand cDNA from each reaction were combined and used as template for DNA PolI-catalyzed 2nd strand synthesis. After the addition of EcoRI adaptors, ds-CDNAs were disectionally cloned into the EcoRI and NotI sites of the pSlip7 expression vector. Plasmid DNA isolated from the library was digested with NotI to remove the treated from the library was digested with NotI to remove the treated from the library was digested with NotI to remove the treated from the library was digested with NotI to remove the treated from the library was digested with NotI to remove the treated from the library was digested with NotI to remove the treated from the library was digested with NotI to remove the treated from the library was digested with NotI to remove the treated from the library was digested with NotI to remove the treated from the library was digested with NotI to remove the treated from the library was manner from the library was digested.
                                                                                                                                                                                                                                                                                                                                                                                                                                              empty vector clones. Linear DNAs from 5.4 to 7 kb were gol
purified and ligated at low concentration to promote
recircularization. Ligation products were precipitated and
transformed into DHIOB host cells. The complexity of the
resulting library was 1.2 x 10X6."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

```
in SOLK cells and plated onto LB-ampicillin agar plates.

Base calling was conducted using Phred. Trimming was performed using Lucy with the following criteria.

(-minimum 200 -error 0.01 0.01 -bracket 10 0.01). A low complexity filter was applied and additional trimming was conducted to remove B. coll, vector, and organelle contamination. After processing -30% of the sequences contained a minimum of 10 Ts at the beginning of the sequence. For reasons that are not understood many of the clones in this library lack an XhoI site at their 3' ends."

/clone lib="armwagh"/
/clone lib armwagh lib after transplanted to high
/clone lib armwagh lib after transplanting. About
libraries (zmrws05 and zmrws48) while 500 roots were
combined from each of the two time points at high water
potential (zmrww00). Each root was divided into 4 segments
/cap): segment 1, 0-3 mm plus the root cap; segment 2, 3-7
mm; segment 1, 0-3 mm plus the root cap; segment 2, 3-7
mm; segment 3, 7-12 mm; segment 4, 12-20 mm. (For details
of conditions see (1) with nutrient modifications as in
(2). The three normalized cDNA libraries were constructed
in the lab of Hans Dehnert (University of Illinois-UC).
Total RNA was extracted by the 'hot Phenol' method (Plant
Molecular Biology mannal. Ds: -13, 2nd ed., 1997). This
method worked in eliminating carbohydrate material present
in the root tips. The integrity of the RNA was verified by
denaturing agarose gels and spectrophotometry (ratio Adenaturing 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                was converted to domine benamed the was converted to deferent segment of the root was added to the 3 -end of the modified Oligo(dT) primers, including a Not1 site and used to reverse transcribe the segment-specific mRNAs into cDNAs. Each library contains all four tags. A suffix ($1, $2, $3, or $4$) has been added to each sequence identifier to designate which region of the root (Root_segment_1, 2, 3, or 4) the sequence was found in based on the identification of the tag. A suffix of so indicates that the sequence tag, and hence the source segment, could not be identified. The double strander cDNAs were size-selected ($450 bp). Size selected cDNAs were adaptored with EcoRI adaptors at both ends, and then digested with NotI. The cDNA was directionally cloned into EcoRI-NotI digested pBS II SK(*) pagemid vector (Stratagene) and electroporated into E.coli DH10B. The total number of white colony forming units (cfu) in the primary libraries before amplification was as follows: zmrws05: 3.37 x 106; zmrws06: 3 x 206; zmrws06: 3 x 206. The background of empty clones was less than 1%.
                                                                                                                                                                                                                                                                                                                                                                                                                                l (bases 1 to 660)

PURS. Plasmid DNA from the primary libraries then was converted to single-stranded circles and used as a template for smplification using the T7 and T3 priming sites that flank the cloned circles and used as a template for PCR amplification using the T7 and T3 priming sites that flank the cloned cDNA inserts. The purified PCR products, representing the entire cDNA population cloned in each library were used as a driver for normalization. Hybridization between the single-stranded library and the PCR products was carried out for 44 hours at 300C. Non-hybridized BNA endered DNA circles were separated from hybridized BNA rendered partially double-stranded and electroporated into DH10B. The total number of clones with insert was: znrw805: 2.0x107; zmrw846; 4.2x107; zmrw800: 1.1x107. The background of empty clones was less than 2%. Insert size, determined by PCR of the entire library, ranged from 0.5kb to 2.5kb. (1) Sharp R B; Silk W K; Hsiao T C. Growth of the Maize Primary Root at Low Water Potentials I. /done lib-"amrenubl library was created by subtracting the water-targeted maize root library amwwwoof from the water-starved maize root library amwwwoof from the water-starved maize root library amwwwoof from the water-starved maize root libraries zmrwwoof and zmrwas9.

The 3 starting libraries are described below in (3).

Purified plasmid preps from zmrwas05 and zmrwas98 were combined. Sequenced clones from the zmrwwool library were pooled and converted into single-stranded circles and used as a driver for subtraction. The PCR products from the driver were hybridized with the single-stranded version of the zmrws05-zmrws48 library for 88 hours at 30 oC. Unhybridized single-stranded DNA circles were separated from hybridized blank rendered partially double-stranded and electroporated into DH1108 cells to generate the subtracted library. The total number of clones was 2 x 106 cfu. Background of empty clones (detected by blue/white selection on agar places) was approximately 10%. Insert size of the subtracted library, determined by PCR of the entire library, ranges from 0.5 to 2.1kb). (3) Root samples were collected in Robert E. Sharp's lab
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CK827377 603 bp mRNA linear BST 03-MAR-2004

(2)). The three normalized CDNA libraries were constructed for the lab of fams bonner (University of Illinois 10.7). The total RNA was extracted by the 'hor Phenol' method (Plant Molecular Biology manual DS: 1-13, 2nd ed., 1997). This method worked in eliminating carbohydrate material present in the root tipe. The integrity of the RNA was verified by denaturing agarose gels and spectrophotometry (ratio Aso/280). Poly(A)-mRNA was isolated bytice from total RNA using the Oligotex Direct mRNA kas isolated bytice from total RNA was converted to double-stranded CDNA and tagged by using modified Oligo(dT) primers. One of a sequence tagged by using corresponding to a different segment of the root was added to the 3'-end of the amdilied Oligo(dT) primers. One of a sequence tagged by using a Not! site and used to reverse transcribe the segment-specific mRNAs into CDNAs. Bach library contains all four tags. A suffix (sl., sJ., sJ., or s), the sequence was found in based on the Identification of the tagged by using the root (Root geoment; 2, 3, or 4), the sequence was found in based on the Identification of the tagger of the root of so indicates that the sequence tagger The Contain Manual CONDAS were adaptored with Rol! The CDNAs were adaptored with Econi adaptors at both ends, and then digested with No!! The CDNAs was as follows: rarned CDNAs were adaptored with Econi adaptors at both ends, ince ECONI World digested pBS II SK(+) phagemid vector (ctal number of white colony forming units (cfu) in the transvelo; 3.37 x 105; zmrws61: 487 x 106; zmrws61: zmr

// clone lib-arity |
// clone rocts were used for each of the low water potential
// clone rocts were used for each of the low water potential
// combined from each of the two time points at high water
potential (zmrwwol) Each roct was divided into 4 segments
// combined from each of the two time points at high water
potential (zmrwwol). Each roct was divided into 4 segments
// distances are from the junction of the roct apex and roct
cap): segment 1, 0-3 mm plus the roct cap; segment 2, 3-7
mm; segment 3, 7-12 mm; segment 4, 12-20 mm. (For detatils
of conditions see (1) with nutrient modifications as in
// clone lib-arity were constructed
in the lab of Hans Bohnert (University of Illinois-UC).
Total RNA was extracted by the 'hot Phenol' method (Plant
Molecular Biology manual. DS: 1-13, 2nd ed., 1997). This
method worked in eliminating carbohydrate material present

denaturing agarose gals and spectrophotometry (ratio A260/280). Poly(A)+mRNA was isolated twice from total RAWA using agarose gals and spectrophotometry (ratio A260/280). Poly(A)+mRNA was isolated twice from total RAWA using the Oligotex Direct mRNA wis isolated twice from total RAWA was converted to double-stranded cDNA and tagged by using modified Oligo(dT) primers. One of 4 sequence tags corresponding to a different segment of the root was added to the 3'-end of the modified Oligo(dT) primers, including a Not1 site and used to reverse transcribe the sequence tags of the root (Root-Segment). 2, 3, or 4) the sequence was tound in based on the Identification of the tag. A suffix of 80 indicates that the sequence tag, and hence the sequence identifier to designate which region of the cond in based on the Identification of the tag. A suffix of 80 indicates that the sequence tag, and hence the sequence segment, could not be identified. The double stranded cDNAs were adaptored with EcoRI adaptors at both ends, and then digested with Nor1. The CDNA was directionally cloned then digested with Nor1. The CDNA was directionally cloned the digested with Nor1. The CDNA was directionally cloned the CDNAs were adaptored with EcoRI adaptors at both ends, and the COINAS were adaptored with EcoRI adaptors at both ends, and the COINAS were adaptored with EcoRI adaptors at both ends, and the COINAS were adaptored with EcoRI adaptors at the The ADAS and the COINAS were segment of white colony forming units (cfu) in the primary libraries before amplification was as follows: mrwweb5: 3.37 x 105, zmrww90: 3 x 105. zmrw905: 3.37 x 105, zmrw90: 3 x 105. zmrw905: 3.37 x 105, zmrw90: 3 x 105. zmrw90: 3
